

- 28 -

What is claimed is:

1. An equivalent circuit for a voltage-controlled variable capacitive element, comprising:

5 a MOS transistor having a source and a drain connected to each other;

a first voltage source connected between a source/drain terminal of said MOS transistor and a substrate terminal; and

10 a fixed capacitor connected between a gate electrode of said MOS transistor and said substrate terminal,

said equivalent circuit being used to simulate characteristics of said voltage-controlled variable capacitive element by a characteristics of capacitance between a gate terminal connected to said gate electrode of  
15 said MOS transistor and said substrate terminal.

2. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 1, further comprising a second voltage source connected between said gate terminal and said gate electrode.

20 3. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 1, wherein said MOS transistor is a P-channel MOS transistor.

4. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 2, wherein  
25 said MOS transistor is a P-channel MOS transistor.

5. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 1, wherein said characteristics, to be simulated, of said voltage-

- 29 -

controlled variable capacitive element are C-V characteristics of how gate to substrate capacitance C varies with gate to substrate voltage V.

6. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 2, wherein said characteristics, to be simulated, of said voltage-controlled variable capacitive element are C-V characteristics of how gate to substrate capacitance C varies with gate to substrate voltage V.
7. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 3, wherein said characteristics, to be simulated, of said voltage-controlled variable capacitive element are C-V characteristics of how gate to substrate capacitance C varies with gate to substrate voltage V.
8. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 5, wherein a capacitance value of said fixed capacitor is adjusted so that values of said gate to substrate capacitance corresponding to said C-V characteristics are entirely increased.
9. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 6, wherein a capacitance value of said fixed capacitor is adjusted so that values of said gate to substrate capacitance corresponding to said C-V characteristics are entirely increased.
10. The equivalent circuit for a voltage-controlled

- 30 -

variable capacitive element according to claim 7, wherein a capacitance value of said fixed capacitor is adjusted so that values of said gate to substrate capacitance corresponding to said C-V characteristics are entirely increased.

11. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 5, wherein a voltage value of said first voltage source is adjusted so that a gate to substrate voltage at which an inversion layer is created is shifted in a direction of negative voltage.

12. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 6, wherein a voltage value of said first voltage source is adjusted so that a gate to substrate voltage at which an inversion layer is created is shifted in a direction of negative voltage.

13. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 7, wherein a voltage value of said first voltage source is adjusted so that a gate to substrate voltage at which an inversion layer is created is shifted in a direction of negative voltage.

14. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 5, wherein a voltage value of said second voltage source is adjusted so that values of said gate to substrate voltage corresponding to said C-V characteristics are entirely increased toward the side of positive potential.

15. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 6, wherein a

- 31 -

voltage value of said second voltage source is adjusted so that values of said gate to substrate voltage corresponding to said C-V characteristics are entirely increased toward the side of positive potential.

- 5           16. The equivalent circuit for a voltage-controlled variable capacitive element according to claim 7, wherein a voltage value of said second voltage source is adjusted so that values of said gate to substrate voltage corresponding to said C-V characteristics are entirely increased toward
- 10   the side of positive potential.
